CUMULATIVE BIOSYSTEMATIC INDEX

The Biosystematic Index consists of general taxonomic categories which are coordinated with numbers of abstracts or bibliographic citations (see Coding System, p. iii) published in this issue which contain information pertaining to organisms belonging to that category. Also, an abbreviated CROSS subject heading or subheading is printed adjacent to each entry to provide further insight into the nature of the article. An asterisk (*) to the right of the number denotes mention of one or more new taxa in the article. (See Volume 2 No. 2—Biosystematic Index, page B1-B4 for Explanation of Abbreviations.)

CUMULATIVE CROSS INDEX

ARRANGEMENT—The CROSS Index contains numbers of all references (See Coding System, p. iii) arranged according to the major subject headings or subheadings. Therefore, a given reference number may appear under as many headings or subheadings as are necessary to properly index that specific title. For convenience in searches, both major headings and subheadings are alphabetized and numbers of the references listed under a particular heading or subheading are arranged in six vertical columns.

USE—This index cross-relates all entries which are specifically or generally pertinent to a particular subject. CROSS is useful in selecting references relating to more than one subject heading. The numbers under a given heading may be compared with those under one or more other headings (which could apply to a given interest) and the selection of only those appearing under each specific subject heading would result in a progressively narrower search. For example, reference numbers common to Biochemistry, Studies—Proteins, and Immunology (Immunochemistry) may be matched with those under Genetics and Cytogenetics to locate reference numbers which appear under each heading, thereby facilitating selection of references dealing with genetic implications of fungal proteins having immunological significance.

More specific searches can be achieved by using the CROSS Index in combination with the permuted subject and Biosystematic Indexes. A combination of general key terms from the permuted index with specific subject headings in CROSS may be used to locate information on various interrelated subjects. Likewise, taxonomic groupings in the Biosystematic Index will lead to references pertaining to organisms which may be of interest in specific applications.

These specific applications or fields of interest can be selected by comparing the numbers from Biosystematic and the permuted indexes with those appearing under appropriate section or subsection headings in CROSS. Thus, the CROSS, Biosystematic and Subject Indexes complement each other and should be used jointly.
